1. Based on data adjusted for working days and seasonal effects.  
The seasonally adjusted euro area and EU series are calculated by aggregating the working day adjusted series from individual Member States and performing an adjustment for seasonal effects on these series. Therefore the European seasonally adjusted figures for total retail trade are based directly on the working day adjusted series coming from the Member States and **not on an aggregation of the seasonally adjusted indices from the Member States**. The euro area and EU seasonally adjusted growth rates might differ from the weighted growth rates of the individual Member States. This procedure also implies that the aggregation of total retail trade is not directly based on the published details (food, non-food, fuel).  
The weights of the Member States in the EU and euro area aggregates can be found at:
